

Steps to import a Postman Collection & generate an OAuth token

Importing a Collection in Postman

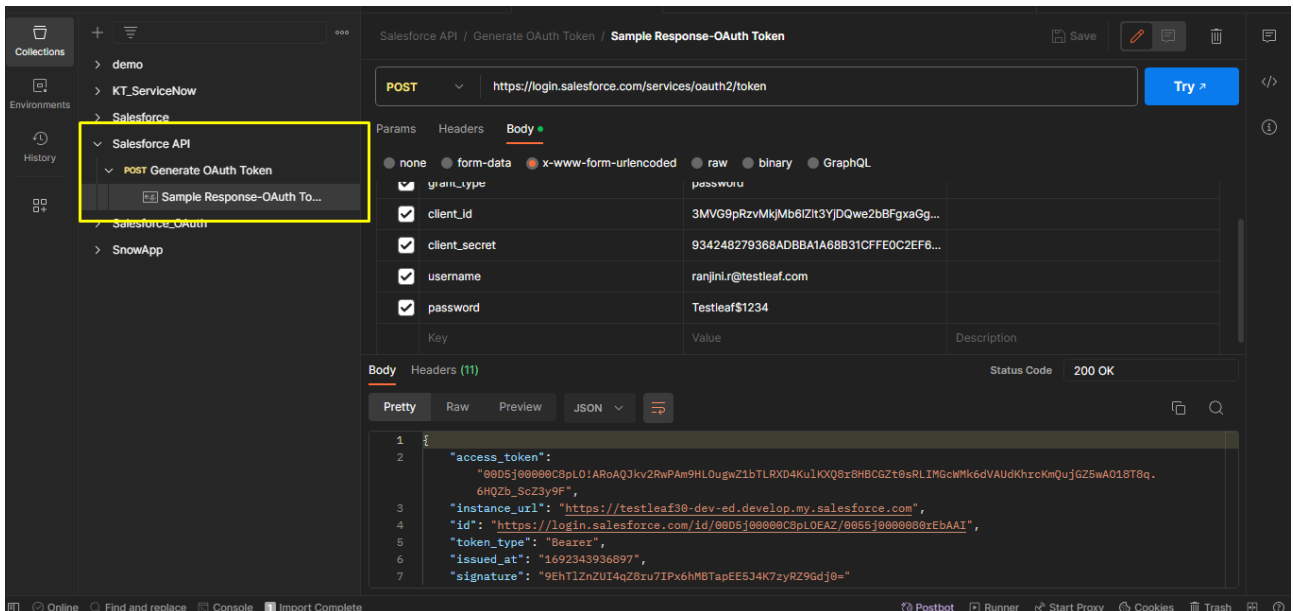

Step 1: Open Postman installed on your system.

Step 2: Click on the 'Import' button at the top left corner of the application.

Step 3: Choose 'Select files' or drop the collection to be uploaded.

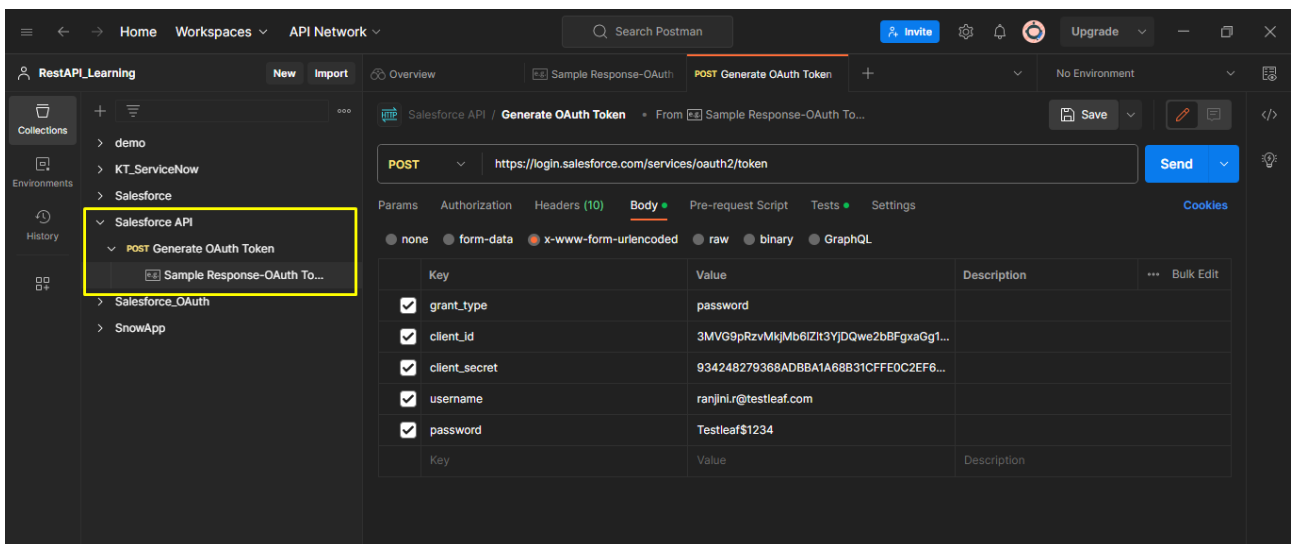

Once imported, the collection will appear in the left sidebar of Postman.

Receiving a Salesforce OAuth Token using Postman

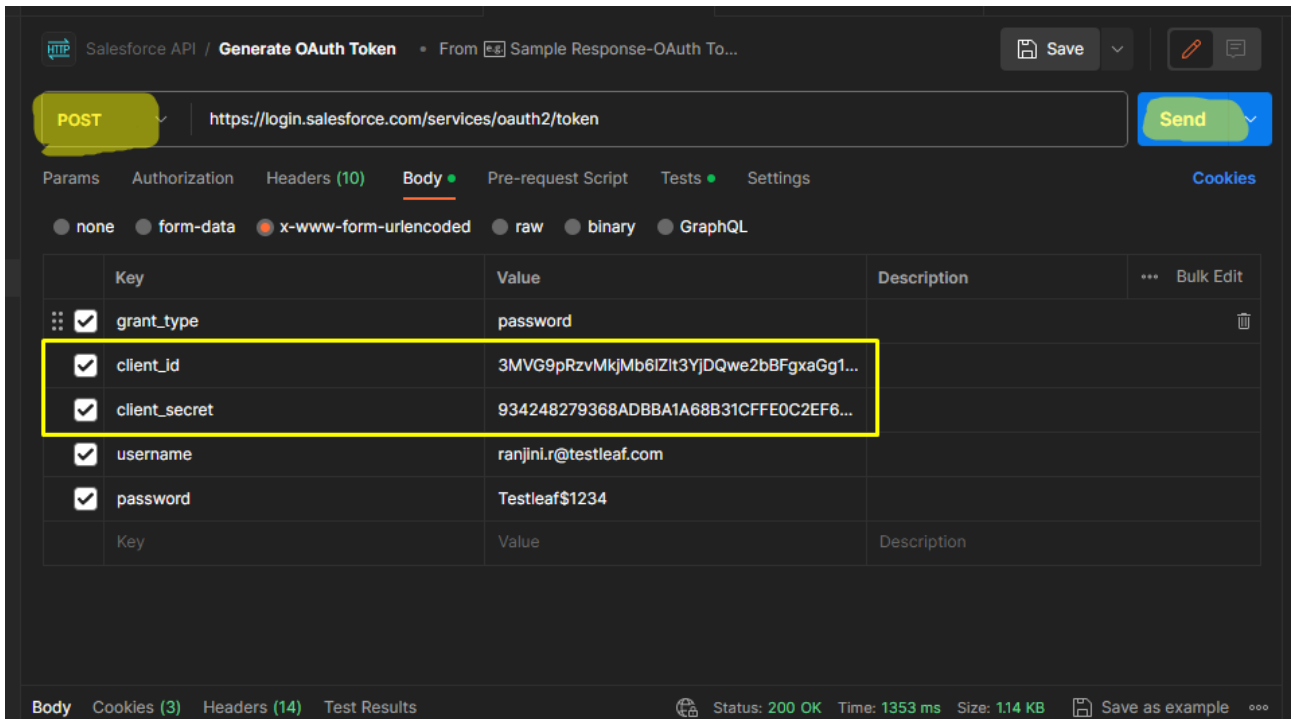

To authenticate API requests in Salesforce, you need to use an OAuth token. Follow the below steps to receive the OAuth token.

Step 1: In Postman, select the imported Salesforce collection.

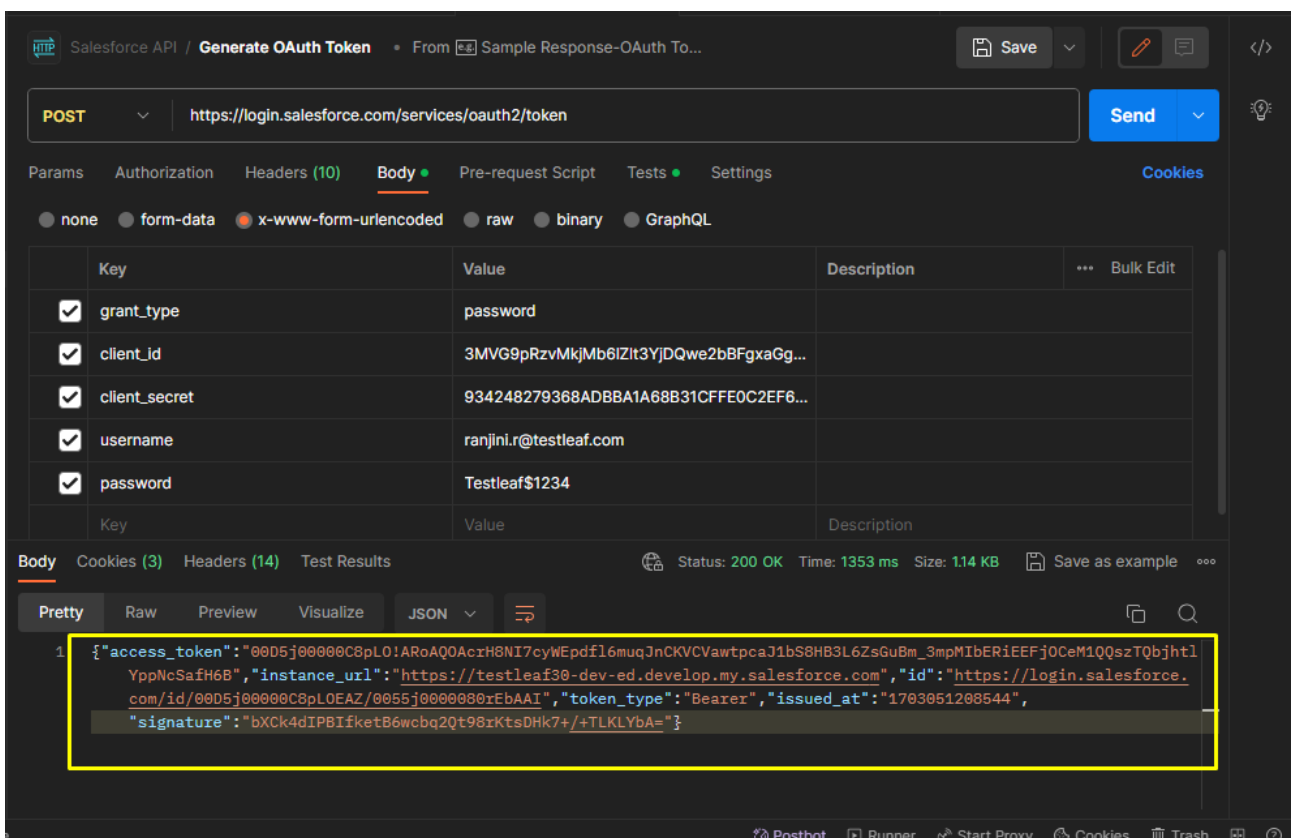

Step 2: Find the request for generating an OAuth token (this should be part of the collection you imported)

Step 3: Before sending the request, ensure that the request body includes your Consumer Key (client_id) and Consumer Secret (client_secret) obtained from Salesforce.

Step 4: Send the request.

Step 5: Upon success, you will receive an OAuth token in the response. This token will be used for authenticating your subsequent API requests to Salesforce.
